Materials

Amino acids, amino acid derivatives, and resins were from Novabiochem. Gel filtration chromatography was performed with Sephadex G-50 resin from Sigma.

Instrumentation

Analytical HPLC was performed with an Aligent C8 column or a Varian Dynamax C18 column with linear gradients. Mass spectrometry was performed with an Applied Biosystems Voyager DE-Pro MALDI–TOF mass spectrometer with sinapinic acid (Fluka) as the matrix at the University of Wisconsin–Madison Biophysics Instrumentation Facility (www.biochem.wisc.edu/bif). Ultraviolet/visible spectra were recorded with either a Cary 50 Bio or a Cary 3 spectrometer.

Strand and Fragment Synthesis

Synthesis of (Pro-Pro-Gly)$_8$-Cys(StBu)-Gly, Pro-$\alpha$1(StBu). Fmoc-ProProGly-OH (Fmoc = fluorenylmethoxycarbonyl) was synthesized as described (1). Pro-$\alpha$1(StBu) (StBu = tert-butylthio) was then synthesized on Fmoc-Gly-PEG-PS resin (Applied Biosystems; PEG-PS = polyethylene glycol-polystyrene copolymer): 1 × Fmoc-Cys(StBu)-OH, 8 × Fmoc-ProProGly-OH, cleaved from the resin with 95:2.5:2.5 TFA/H$_2$O/iPr$_3$SiH (8 ml, 2 h; TFA = trifluoroacetic acid, iPr = isopropyl) and precipitated from tert-butylmethyl ether: 58% yield; MS (MALDI–TOF) [M+H]$^+$ calculated for C$_{105}$H$_{155}$N$_{26}$O$_{27}$S$_2$ 2277.6, found 2277.6; HPLC $t_R$ 17.79 min [Aligent C8 column, 85:15–15:85 H$_2$O/CH$_3$CN containing TFA (0.1% vol/vol) over 50 min].

Synthesis of (Pro-Hyp-Gly)$_8$-Cys(StBu)-Gly, Hyp-$\alpha$1(StBu). FmocProHypGly was synthesized as described (1), but with Hyp in the Yaa position (no tert-butyl protection was necessary). Hyp-$\alpha$1(StBu) was then synthesized on Fmoc-Gly-PEG-PS resin: 1 × Fmoc-Cys(StBu)-OH, 8 × Fmoc-ProHypGly-OH, cleaved from the resin with 95:2.5:2.5 TFA/H$_2$O/iPr$_3$SiH (8 ml, 2 h) and precipitated from tert-butylmethyl ether: 64% yield; MS (MALDI–TOF) [M+H]$^+$ calculated for C$_{105}$H$_{155}$N$_{26}$O$_{35}$S$_2$ 2405.6, found 2406.2; HPLC $t_R$ 14.89 min [Aligent C8 column, 85:15–15:85 H$_2$O/CH$_3$CN containing TFA (0.1% vol/vol) over 50 min]. The sample was heated at 80°C for 5 min prior to injection onto the column; otherwise a peak for folded trimers ($t_R$ ~22 min) was observed.

Attachment of Fmoc-Gly-OH to HMPA–PEGA resin, Fmoc-Gly-PEGA. HMPA–PEGA resin was obtained from Novabiochem already preswollen in MeOH with an approximate wet loading of 0.072 mmol/g. Preswollen HMPA–PEGA resin (1.545 g, 0.111 mmol; HMPA–PEGA = 4-hydroxyxemethylphenoxacyetyl-polyethylene glycol-polyacrylamide copolymer) was washed with CH$_2$Cl$_2$ (3 × 5 ml) and dried under high vacuum for 1 h to remove all MeOH. The resin was then swollen in DMF (N,N-dimethylformamide) for Fmoc-Gly-OH attachment.

In a flame-dried flask under Ar(g) atmosphere, Fmoc-Gly-OH (331 mg, 1.11 mmol) was dissolved in CH$_2$Cl$_2$ (10 ml) and DMF (0.5 ml). The clear solution was cooled to 0°C, diisopropylcarbodiimide (87 ml, 0.56 mmol) was added and the mixture was stirred at 0°C for 30 min to generate the symmetrical anhydride. The solution was concentrated to remove CH$_2$Cl$_2$, DMF (3 ml) was added, and the anhydride solution was filtered through cotton (to remove the insoluble urea) into the swelled resin suspension. A solution of dimethylaminopyridine (1.4 mg,
0.11 mmol) in DMF (0.1 ml) was added, the vessel was purged with Ar(g), and the suspension was agitated gently for 1.5 h. The resin was then drained, washed with DMF (7 × 10 ml) and CH₂Cl₂ (7 × 10 ml), and dried under high vacuum to give Fmoc-Gly-PEGA. Resin-loading was measured by ultraviolet spectroscopy to be 0.25 mmol/g.

**Estimation of Assembly Length from Rₜ**

The lengths of assemblies (1)ₙ and (2)ₙ were estimated from the Rₜ values measured with DLS by using the Broersma relations (Eq. 1) (2–4) and Tirado and Garcia de la Torre relations (Eq. 2) (5, 6), as described for collagen (7).
Broersma (2–4) relations:

\[ 0 = 2R_h[\delta - \left(\frac{1}{2}\right)(\gamma_\parallel + \gamma_\perp)] - L \]  
\[ \delta = \ln(2L/d) \]
\[ \gamma_\parallel = 0.807 + 0.15/\delta + 13.5/\delta^2 - 37/\delta^3 + 22/\delta^4 \]
\[ \gamma_\perp = -0.193 + 0.15/\delta + 8.1/\delta^2 - 18/\delta^3 + 9/\delta^4 \]

Tirado and Garcia de la Torre (5–6) relations:

\[ 0 = 2R_h[\ln(p) + \nu] - L \]  
\[ p = L/d \]
\[ \nu = 0.312 + 0.565p^{-1} - 0.1000p^{-2} \]

In Eqs. 1 and 2, \( L \) is the rod length and \( d \) is the rod diameter. After assuming that \( d = 1.36 \) nm for collagen (8, 9), Eqs. 1 and 2 were solved for \( L \) with the FindRoots algorithm of Igor Pro (Wavemetrics).

Fig. 5. Rate of assembly of fragments 1 and 2 (200 μM) over 12 h, monitored at 226 nm after a rapid transition from 90 to 10°C. The maximal change in ellipticity ([θ]_{max}) for each sample was calculated as the difference between the ellipticity prior to denaturation (100% assembled) and the first data point at 10°C, thus omitting the initial jump in ellipticity (which was not resolvable) (9). The value of “% assembled” was then calculated as the ratio of the observed recovery to [θ]_{max}. Data were from solutions in 50 mM HOAc(aq) at pH 2.9.
